

Statistics faculty actively seeking new PhD advisees

Alphabetical by last name

Sujit Ghosh

- 1. Interested to advise or co-advise new students beginning Fall of 2027
- 2. Potential research topics: Bayesian machine learning methods with applications in astrostatistics, biostatistics and finance
- 3. Some recent papers available on NCSU CI profile ([link](#)) and some recent students' theses that he has supervised:
 - (a) Bayesian Methods for Dichotomous, Large, and Massively Large Data (Hyoshin Kim, 2025)
 - (b) Global Optimization and Time Series Forecasting (Xinyu Zhang, 2024)
 - (c) Subsampling and Active Learning (Qun Sui, 2023)
- Email address: sghosh2@ncsu.edu
- Academic website: <https://www4.stat.ncsu.edu/~sghosh2/>

Jungeum Kim

- Advising: it would depend on my capacity at the time of contact
- I work on valid uncertainty for models we cannot easily write down, such as generative AI
 - 1. Conformal prediction: prediction sets that stay valid without assuming the model is correct, including for AI system
 - 2. Simulation-based inference and uncertainty-aware Bayesian optimization for scientific discovery, such as protein design
 - 3. Scalable inferential models and imprecise probability
- Email address: jkim255@ncsu.edu
- Academic website: <https://jungeumkim.com>

Amanda Mejia

- Seeking 1-2 graduate students, with possible funding support from NIH R01 grant
- Potential projects include
 - Spatial Bayesian models for functional MRI
 - Spatial smoothing spline models for functional MRI
 - Bayesian ICA with functional connectivity dynamics
 - Various other projects related to fMRI and Bayesian models

- Email address: afmejia@ncsu.edu
- Academic website: <https://www.statmindlab.com/>

Jonathan Stallrich

- Can take on 1 student and/or co-advise
- Some funding for students but not full semester funding
- Research mainly focuses on experimental design but has been pushing these beyond the classical methods. In particular, has interesting, novel projects about:
 1. Design and analysis of computer experiments
 2. Experimental design with functional predictors
 3. Optimal designs for generalized linear models
 4. Optimal designs for penalized estimators (see link)
 5. A/B testing in the presence of networks (see link which is a review paper he coauthored that has nearly 13,000 views)
- Email address: jwstalli@ncsu.edu
- Academic website: <https://jonstallrich.com>

Jonathan Williams

- Will take 1-2 students in Fall 2027
- Email address: jwilli27@ncsu.edu
- Academic website: <https://jonathanpw.github.io>
